MACRO X

OWNER'S MANUAL

OWNER'S MANUAL

FIREDIES PRODUCTIONS · OXFORD · FD-2026-MX-V1.0

One key. Every job.

Macro X turns one press into your whole routine—launch apps, send shortcuts, type text, click, wait for things to actually be ready. And the key itself tells you the truth: a progress bar while it runs, a green tick when it worked, a red cross with the exact step that failed when it didn't.

Nothing is faked. Nothing leaves your PC unasked.

02 QUICK START

1. Drag **Macro X** (under **Macro X**) onto any key—or onto a dial, where press, hold, tap and each direction of turn hold a macro of their own.
 2. Press it. Every window minimizes—a fresh Macro key is the classic panic button out of the box. Press again and your windows come back.
 3. Open the key's settings and make it yours: a name, your own picture, your own steps.
-

03 THE FACE

- **Your image**—PNG, JPG, SVG, or an animated GIF (it really animates on the key). **Zoom from 20% to 300%** and pan it, so you can crop right into a photo instead of being stuck with the whole frame. No image? You get the Macro X mark—or the Firedies phoenix if you prefer it—tintable to any color.
- **The name is yours to show or not**—keys stay clean by default. A panic button doesn't need PANIC written on it.
- **While running**—the key dims, a progress bar fills, and a counter shows which step it's on.
- **Green tick**—every step ran. **Red cross + STEP 3**—it stopped at step three, and that's the honest truth, not a guess.

A list that runs top to bottom.

Each step is set up with dropdowns and fields—no code needed.

STEP	WHAT IT DOES
Run script / app	Opens a program or runs a script: <code>.exe</code> <code>.ps1</code> <code>.py</code> <code>.ahk</code> <code>.bat</code> and more. Can run hidden. If Python or AutoHotkey isn't installed, the settings say so up front.
Open	Opens a file, folder, or web address.
Hotkey / type text	Presses a shortcut—friendly names like <code>ctrl+s</code> or <code>win+e</code> (yes, the Windows key works; a premade picker holds the common ones, snip and Game Bar included). Or pastes saved text wherever your cursor is— instant, and it keeps every symbol, emoji, and line break exactly. Because it pastes, it needs an app that accepts Ctrl+V, and it borrows the clipboard for a moment: copied text is put back afterwards, but a copied image or file is not.
Mouse click	Moves the mouse to a screen spot and clicks. Press Grab position , hover where you want for three seconds, and the spot is captured. Tick "put the mouse back" and your cursor returns afterwards.
Window	Focuses, minimizes, maximizes, or restores a window by its title.
Wait	Waits a fixed time—or until a window exists, or until a program is running. Real waits instead of guessed delays, with a timeout that fails honestly.
Play sound	A chime (eight built in) or your own WAV/MP3, at your volume. A macro can also ring a finish alarm that loops until you press the key—or for five minutes, whichever comes first. (The press that silences it also runs the macro again.)
Show desktop	Minimizes everything; press again to bring it all back. Works even where sent keystrokes don't.
Ask Claude	Describe a job in plain words and Claude does it on your machine. Needs your own Claude account—see section 05.

Every step can also carry a **condition**—run only if a certain program is (or isn't) running. That's how "open OBS, but only if it isn't open already" works. A failing step can **retry** for apps that load slowly. Supported file formats for images, sounds, and scripts live in section 10.

Plain words in. Real work out.

One step hands a job to Claude on your machine—"tidy my desktop", "open Audacity and start a new project", "what's my local IP". You write it the way you'd say it.

Bring your own Claude

Macro X does not include AI. The Claude step drives **Claude Code**—Anthropic's free-to-install tool—signed into your own Claude account. Anything Claude does is billed by Anthropic under *your* plan, never by Firedies, and we never see your login. Without it, this one step fails honestly with a red cross; every other step works without it.

Setup, once: install Claude Code from claude.ai/code, run `claude` in a terminal and sign in. Done—the step finds it from then on.

Answer, or do

A plain step means Claude only **answers**—to a live window, your clipboard, or Notepad, your choice. Set **Mode** to **Do the task** and Claude actually acts: opens apps, runs commands, edits files—on your PC, under your login. Your button, your call: give "do" the respect you'd give a capable stranger at your keyboard.

You watch it work

While Claude runs, the key wears an ember **WORKING...** face, and it stays there for as long as Claude is still working—up to twenty minutes, after which the key hands the job over to the window and stops waiting on it. The window streams each step as it lands ("→ Run: ...", "→ Edit ..."), then the key shows the real verdict: green tick, or red cross.

In Macro Code

```
claude "what's my local IP" out clipboard
claude "tidy my desktop" do
claude "summarize TODO.md" dir "C:\project" out notepad
```

`do` = let it act · `dir` = the folder it works in · `model` = pick one · `out` = window / clipboard / notepad.

Build in steps. Share as a code.

Every macro can be copied as plain text and pasted anywhere—Discord, Reddit, a note to a friend. Paste someone else's code and their macro becomes yours. The code box and the blocks are the same macro, live: edit either one and the other follows.

```
name: GL HF
hotkey enter
wait 15
type "gl hf"
hotkey enter
```

The grammar, one line per step:

hotkey enter	press a key—friendly names, even win+e
type "Thanks for reaching out"	paste text at the cursor (instant, reliable)
open "https://mail.google.com"	open a file, folder, or site
run "C:\path\to\script.py"	run a script or app (add: hidden, args, dir)
window focus "OBS"	focus / min / max / restore a window
wait 300	wait milliseconds
wait window "OBS"	wait until a window exists
mouse 1520 830 left	move the mouse and click (add "back")
sound chime3	play a chime, or your own file (add: vol 80)
showdesktop	the panic button as a step
claude "tidy my desktop" do	hand the job to Claude—see 05 (your own account)

Extras: add `| if obs64 running` (or `not running`) for a condition, `| retry 3` for more goes, start a line with `#` for a comment, or `#off` to keep a step but disable it.

Live tokens in typed text expand when you press: `{date}` · `{time}` · `{datetime}` · `{isodate}` · `{day}`. So `type "Note {datetime}"` writes the real date and time—the classic insert-date macro, built in.

The trading post: the full grammar, ready-made presets, and the community's shared codes live at github.com/FirediesProductions/stream-deck—paste a code from there and it just applies.

Teach Claude the format

A free Claude skill sits in that same repo. Copy `firedies-macro-skill` into `~/ .claude/skills/firedies-macro-x/`, then just ask—*"a macro that opens OBS if it isn't running"*—and Claude writes a paste-ready code, using only grammar the plugin really parses.

Ready-made starts, by category.

The dropdown is sorted into groups so you find one fast:

Text & Type — Insert Date · Timestamp · Paste Plain · Instant Reply · Paste My Email

Windows & Screens — Snip To Share · Screenshot To File · Split Screen · Send To Other Screen · Reopen Closed Tab · Clipboard History · Emoji Panel · Lock The PC

Media — Play / Pause · Next Track · Mute Volume

Gaming — GL HF · Clip The Last 30s · Save That Clip · Record Screen · Panic Button

AI · your own Claude — Fix My Writing · Explain This · Commit My Work

Pick one, then change any path or text to yours. The shortcut ones work out of the box; the Claude ones run on your own Claude (section 05). Built something good? **Save current as preset** puts it in the list on every Macro key you own.

One key, more than one face.

Switch **Key type** to *Cycles between states* and the key becomes a toggle—or a cycle of up to six states. Each press runs the current state's steps, then the key wears the next state's face: its own image, its own word. The classic: a Discord key that shows **MUTED** after you mute and **LIVE** after you unmute.

For recording keys, tick **live timer** on a state—while it's active the key shows a pulsing red dot with the time counting up. Honest believed-state: for apps that can't be asked, the key shows what it believes from your presses. Where reality can be checked—is a program running, does a window exist—Macro X checks reality.

Tick **Hold action** and holding the key for half a second runs a *different* macro than a quick press. Mute on press, deafen on hold. Clip on press, screenshot on hold. One key, two pockets.

10 WHAT FILES WORK

WHERE	FORMATS
Key face	PNG, JPG, SVG—or an animated GIF (it really animates). No image? The Macro X mark or the Firedies phoenix, tintable, or a plain color fill.
Sounds	Eight built-in chimes, or your own WAV / MP3—most audio Windows can play (M4A, FLAC) works too.
Run step	.exe · .bat · .cmd · .ps1 · .py · .ahk—the right runner is found for you (honest heads-up if Python or AutoHotkey is missing); anything else opens the Windows way.
Macro codes	Plain text. Copy, paste anywhere, share freely.

11 HONEST LIMITS

We'd rather tell you now.

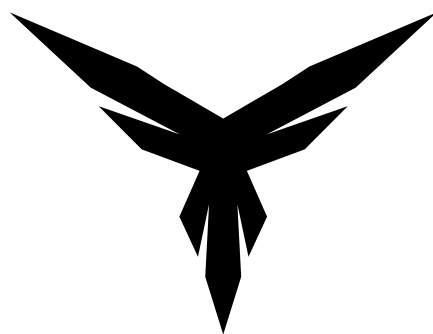

- **Sent keystrokes can't reach everything.** Programs running as administrator ignore them—if Windows refuses, the key shows the red cross instead of half-typing—and many games block fake key presses (anti-cheat). Macro X is not a game-input tool. Save That Clip still works in games because NVIDIA's overlay catches the hotkey, not the game.
- **Ask Claude needs your own Claude.** The AI isn't bundled—the step drives the Claude Code you install and sign into yourself, billed by Anthropic under your plan. Without it, that one step fails honestly; everything else works.
- **Toggles show believed state** for apps that can't be queried. Press the key, not the app, and the faces stay in sync.
- **Everything else runs on your machine.** No account, no sign-up, no analytics. The only thing that leaves your PC is what you hand to a Claude step—your prompt, and on "Do the task" whatever Claude reads or runs to carry it out—from your machine to Anthropic, under your own account.

12 FREE

Macro X is free—the whole thing. No locked buttons, no trial timers. So is **Metrics**: CPU, RAM, GPU, VRAM and disk, live on a key.

If they save you time, the paid Firedies plugins are what keep them alive: **Ping** (network + speed test), **Focus** (pomodoro, timer, clock & calendar), **Rank Showcase** (your rank, live) and **Now Playing** (what's playing).
